

CLOUD³

better x faster x cheaper

CHOOSE ALL THREE WITH CLOUD COMPUTING SOLUTIONS.

It's a great time to be using information technology for your business, thanks to cloud computing.

Businesses of any size can now utilize powerful applications that are simple to use, reliable, fast and, best of all, incredibly affordable.

The concept of cloud computing is rather simple: centralize all the server hardware and applications and let businesses access them through the Internet. Fast Internet connections and advanced server technologies make it possible.

With cloud hosted applications a business doesn't have to own and maintain servers or pay to purchase and update software. An application that in the past might have cost thousands of dollars to implement can now serve a business for a few bucks per user per month. And since the software is delivered via Internet, your business tools will be easy to use and accessible from multiple locations.

PUBLIC CLOUD. PRIVATE CLOUD. HYBRID CLOUD.

When most people think of cloud computing they think of public cloud applications like Salesforce or Google docs. These are webhosted services that are available to anyone. The private cloud is another option. Private cloud applications are centrally hosted but proprietary to a small number of users. Private clouds can also be assembled to serve larger businesses with multiple units who need to centralize and share IT resources. And then there's the Hybrid cloud, integrating public and private solutions to get the most power and economy.

WHEN TO BE IN THE CLOUD AND WHEN TO SAY ON THE GROUND

While cloud computing is an excellent way to get powerful technology at a reasonable cost, you may not want to put all your business in the cloud. PC Solutions can help you assess the big picture of your technology needs and help you choose what works best in the cloud and what would serve you better "on the ground".
